

GRANITE TRANSFER BOARDS

TRANSFER BOARDS

The ideal surface upon which to make imbibition prints should:

- be flat
- have a tooth
- be free from corrosion
- have register pins

We are prepared to furnish TRANSFER BOARDS of granite and plate glass. Standard sizes are in stock.

Granite satisfies all above conditions and in addition has a porosity which enables it to retain moisture. The adhesion of wet paper to granite is better than it is to glass.

Plate glass satisfies the above conditions except for the rough surface and has long been satisfactorily used for making dye prints.

Plate glass is more practical for very large prints where size and shipping become a limitation with granite boards.

Register pins are mounted in two ways:

1. Register pins are mounted on a .015" stainless steel strip which is then cemented to the transfer board. With this method, the pin alignment cannot change.

2. Holes are drilled in the transfer board and pins are fastened from the bottom with nuts. The mounting cost is the same for either method.

A stainless steel bar 1/8" x 2" x 22" with register pins is available for custom built transfer tables. This bar is fastened by screws to a waterproof table which is higher in the front than the back to facilitate drainage. A sheet of plate glass is clamped to the table so that the top of the glass and the top of the register bar are level and there is the space of one film thickness between the two. It is important the glass does not move between transfers.
